Methods

I utilized a Social Survey Platform as the method of obtaining participants with the advantage of ease of use for participants. I utilized Google Forms to create the Likert Scale yes/no responses for the survey. The number of survey participants as (20) individuals that completed the survey in an anonymous format. The number of interview participants as (2) individuals that completed the questions in an anonymous format.

Design –

The design is primarily quantitative data and limited qualitative data with the Likert Scale as yes/no responses for the survey. It is limited in comprehension of attitudinal measurements without including open/ended questions. The most comprehensive data will “measure the full range of variation, then you’d operationalize attitudes” included in the design to measure attitudes as degrees of intensity for the interview questions (Babbie, p. 139.

Participants –

The Google Forms distributed at the Public Library with instructions to participate in an anonymous format. The participants are limited to (20) individuals that appeared on the survey scheduled date. The public facility utilizes a logical approach for sampling participants.

Participant 1 Profile

Fluent English

Adults Aged 45

Participant 2 Profile

Fluent English

Adults Aged 53

Measurement –

The design is primarily quantitative data and limited qualitative data with the Likert Scale as yes/no responses for the survey. It is limited in comprehension of attitudinal measurements without including open/ended questions.

Data Collection Procedure

I arranged the survey questionnaire at the desk of the public library on the day scheduled for the survey. I requested that the survey be turned face down at the desk when completed. I returned the next day to retrieve the completed surveys. I reviewed the responses for the closed/ended questions. The survey is limited in comprehension of attitudinal measurements without including open/ended questions. The ethical considerations are contained to the retaining the anonymous format and not disclosing the information.

Section Conclusion

In conclusion, the methods stated for ease of use and the use of a public facility are easy methods to locate participants. The design could be more comprehensive to incorporate attitudinal measurements, yet the method is utilized by interview respondents because of the explanatory nature of a face-to-face interview.

Analysis

The data not collected as instructed ‘not to collect data due to not grading my assignments’ never received approval.

Can you describe the daily work of Police Officer?

I responded to the front lobby to meet with a complainant. I went into my office and read through the daily report system. I met with the records department. I responded to the locations with the daily patrol. I drove my vehicle in for maintenance. I checked vehicles for speeding on the roadways. I went to court for a traffic fine.

Anonymous Participant:

Ava is a Patrol Officer. She has more than 15 years of experience as a police officer. She serves as one of the first female officers on her shift. Ava has shown her commitment to her local government when she states, “I am willing to work with the citizens to help them understand how to protect themselves in every-day life.” in her testimony.

Part 2

I worked on the classification of coding by a set of categories developed as reliable responses. After reading the responses from the interviews then I determined that the data be quantified by assigning numbers to the variables.

Discussion

The knowledge that both the agreement reality and experiential reality are special standards within scientific communities for determining the research analysis. The implications of questionable scientific scenarios as not good methodology for research analysis. The questionable scientific method of interviewing for religious questions as complex moralities with limitations into responses. The natural moral code of beyond explanatory responses as experiential reality when reevaluated as a specialized diversity. The limitations of religion questionnaires as research analysis without further explanation in so much so that no greater understanding of the complexities of such. The future responses are doubtful as to the same constraints and limitations within the agreement reality and experiential reality.
